DEEP DOWN YOU WANT THE BEST  
scubapro-uwatec.com

### Field info related to the MK25 1<sup>st</sup>. stage

One of the primary features unique to the SCUBAPRO MK25 1<sup>st</sup> stage is the ability to set IP adjustments externally during annual service. In that the set-screw is exposed to water, SCUBAPRO uses a high-end quality paste to retard water entry. The area we are describing is circled in orange below. The brand name paste used in production is **Chesterton GOLDEND® paste made by DuPont®**,

(web link below). While use of this paste is the best choice, suitable alternatives like: CrystoLube®, Krytox® and approved SCUBA silicones will suffice, in copious amounts applied to the set-screw male threads. Proper lubrication is covered in our regulator tutorial two disc set-DVD, p/n PR.203.200. The paste is used externally and is not in contact with HP gas, (only ambient pressure).

#### Product details and optional suppliers:
